

Workshop 3. Quality Management

Organised by Statistics Finland, Office for National Statistics of United Kingdom and National Institute of Statistics and Geography of Mexico

The workshop will discuss how the CPI production process can be monitored and how to ensure the over-all quality of the published CPI. This will include management and quality assurance of the various steps of compiling the CPI, from the planning of the sample of products, the regular price collection, data validation, calculation and publication of the figures. The workshop will discuss different quality assurance frameworks, such as ISO and the European Statistics Code of Practice, how these can be applied in practice, how to ensure that all tasks are taken care of in a tight production schedule, and from a cost/benefit view point, if particular aspects of the various quality assurance approaches generate greater value and so should be retained if resources are reducing. The discussions will be based on presentations and through practical examples of the participating countries.

Draft Agenda of the Quality Management Workshop

Managing the CPI and PPI under ISO 9000. Presentation by INEGI
